We use advanced laser technology to fully release your child's tongue-tie in a precise, quick, and sedation-free procedure.

We use a laser for all of our frenectomies and the procedure takes less than 30mins and no stitches are necessary. A laser works with light energy so there is very little discomfort. There is almost no bleeding and some babies and children sleep through the procedure. The laser sterilizes upon touch, therefore the risk of infection is minimal, if any. Healing occurs quicker and without complications. The result is healthy, well-healed tissue with less chance of reattachment (relapse).
